Evidian IDaaS Access is a fully-featured access management-as-a-service solution that integrates cutting edge multifactor authentication (MFA), identity federation and single sign-on (SSO) solutions for an outstanding user experience with an added level of security. The solution delivers fast time-to-value through quick onboarding, scalability and flexibility.

Facilitate access management of hybrid infrastructures

Businesses are aware of the multiple benefits of the cloud but migrate at their own pace to mitigate risk, ensure compliance and meet business objectives. Some businesses may even decide to keep dedicated and sensitive applications on-premises. Evidian IDaaS Access facilitates access control management for all applications and assists businesses at every step of their migration journey.

Evidian IDaaS Access provides all user profiles with a secure single point of access to applications, replacing multiple existing access pages that use less secure dedicated authentication solutions. It also supports fine-grained synchronization capabilities for provisioning identities available on-premises or in cloud-based directories.

Support Identity Federation

With Evidian IDaaS Access, it is possible to control who accesses IT resources while delegating partner identity authentication to an external identity provider (IdP). The solution supports security assertion markup language (SAML) 2.0 and OpenID Connect as well as OAuth 2.0 for single sign-on (SSO), identity federation and authorization control. Users can also be provisioned between trusted domains in more complex business environments involving partners and affiliates.

Strengthen authentication

Reinforce security thanks to strong authentication based on multi-factor authentication. Evidian IDaaS Access supports a comprehensive list of authentication mechanisms including Evidian Push Authentication, the latest FIDO 2 framework, and third-party authentication delegation (via RADIUS and SAML).

- Evidian Push Authentication provides fast, convenient, and frictionless one-touch authentication from mobile devices
- Evidian IDaaS Access supports new passwordless FIDO 2.0 authentication.

Enable rich analytics

Evidian IDaaS Access features comprehensive analytics that enable you to sort and enrich its audit trails through an intuitive, dynamic web interface. It provides dashboards for application access, audit activity, password changes, user authentication activity, etc. that enable you to view and analyze events and user activity.

These rich analytics capabilities help you meet your compliance requirements, business security policies and risk management objectives. With analytics for IDaaS Access, you can discover trends, investigate the origin of problems, accurately assess risk, and meet regulatory requirements.
FullFEATUREED ACCESS MANAGEMENT AS-A-SERVICE

Personalize the access portal
Evidian IDaaS Access adapts to the needs of any organization — regardless of size — to provide a highly customizable standalone access portal, or the capacity to integrate into pre-existing corporate portals thanks to the Evidian Connect software development kit (SDK). The navigation menu is dynamically generated to display the right web resources associated with a specific profile and to let users access self-service facilities such as password reset, profile management, and authentication method enrollment.

Increase productivity
Because enterprise mobility has been shown to positively impact productivity, allowing users to connect from anywhere while enjoying a user-friendly experience has become a must.

Evidian universal single sign-on (SSO) combined with strong authentication means users only have to authenticate only once to access all resources, leading to a better user experience and reduced attack surface.

Protect REST API
REST APIs are becoming increasingly popular among developers and data scientists. They are commonly used to create custom applications or to open one's IT system to the internet. With Evidian IDaaS Access, it is easy to protect your APIs by managing API authorization (OAuth 2.0). You can secure publishing with access protection and ensure that only the right resources are accessed by the right users, using the right applications.

Enforce security
Evidian IDaaS Access was built with security in mind to guarantee data confidentiality, prevent session or identity theft, and ensure trust in protecting information streams. Thanks to its self-service functionality, users can manage their passwords and enroll authenticators, thus avoiding exchanging sensitive information with third parties and reducing help desk calls.

Evidian IDaaS Access does not require the use of plug-ins for web browsers or modifications of applications reducing potential risks in working environments.

IDaaS Access can also complement CASB, cloud security and network security as-a-service to provide comprehensive protection for all businesses.

Zero Trust
A significant number of businesses and CISOs are looking to move towards a zero trust security framework, which includes continually assessing access to corporate services regardless of whether they are on-premises, internet-facing, or cloud-hosted. Authentication and access right governance are key topics that need to be addressed to conform to zero trust where every access role must be designed following the least privilege principle – for everyone, always, everywhere.

Evidian IDaaS Access helps build the secure foundation necessary for zero trust by providing a full-featured authentication and access management as-a-service solution.
